DET

Software Defined Networking (SDN)

Andrea Bianco
andrea.bianco@polito.it
<http://www.telematica.polito.it/>

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 1

Outline

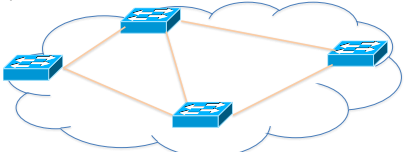

- SDN
 - Motivations and definitions
 - Centralized architecture
 - Flow based forwarding
- Openflow protocol
- Advances
 - Distributed controllers
 - Stateful switches

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 2

Rezford – Computer Network class

Traditional computer networks

- Data plane
 - Local algorithms, dealing with packets
 - Forwarding, filtering, scheduling, buffering, marking, rate-limiting, measuring at the packet level
 - Packet transmission time scale
 - Very fast processing
 - Implemented in HW

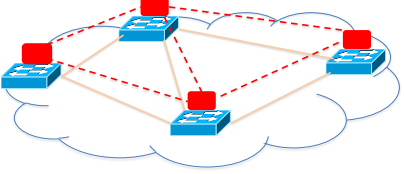

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 3

Rezford – Computer Network class

Traditional computer networks

- Control plane
 - Distributed algorithms
 - Topology discovery, topology tracking, route computation, installing forwarding rules, traffic engineering
 - Seconds time scale, flow time scale
 - Slow process

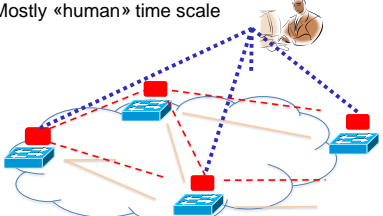

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 4

Rezford – Computer Network class

Traditional computer networks

- Management plane
 - Local/global algorithms with coordination
 - Measurement, configuration, monitoring, protection and restoration
 - Mostly «human» time scale

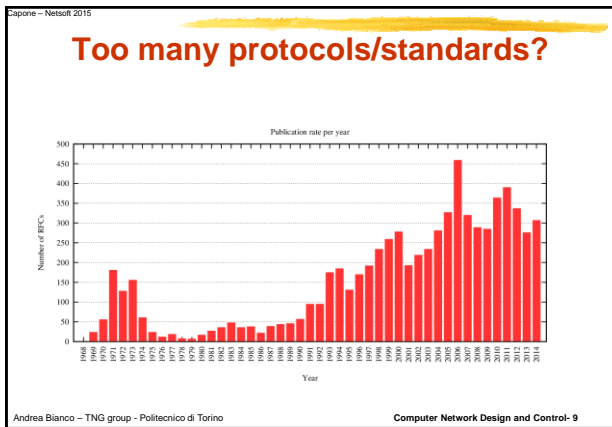

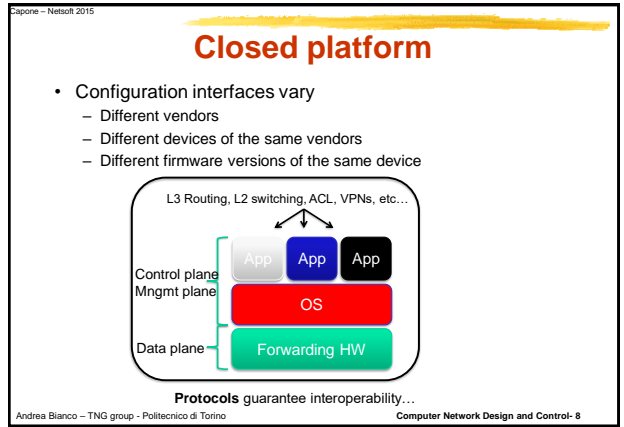

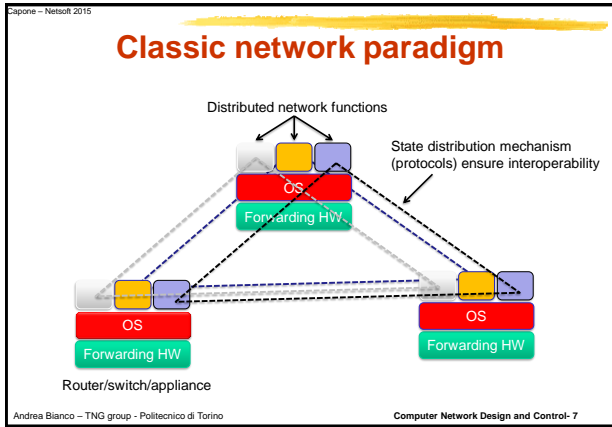

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 5

Traditional computer networks

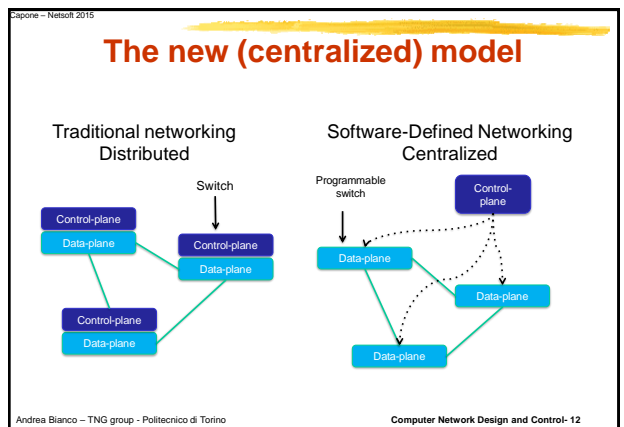

- Features
 - Incredible success (from research experiments to global commercial infrastructure)
 - «In principle» complexity at the edge
 - «Only» packet forwarding inside
 - Complexity at the edge (SW) enables fast innovation
 - Host running increasingly complex applications (SW)
 - Web, P2P, social networks, virtual reality, video streaming
 - Inside the network?
 - Closed equipments, SW and HW intermixed, vendor specific interfaces, many more features beside forwarding, too many protocols
 - Slow and costly development and management

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 6

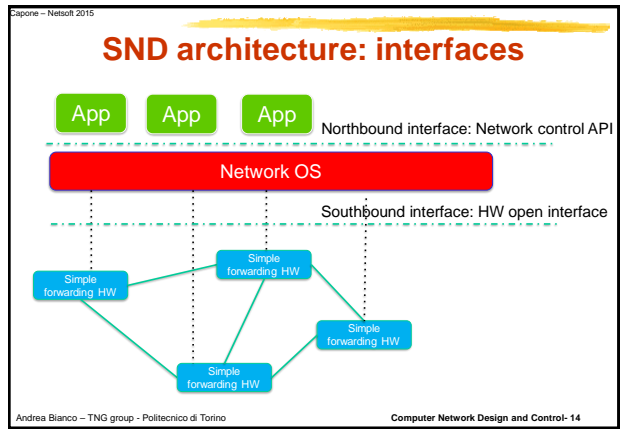

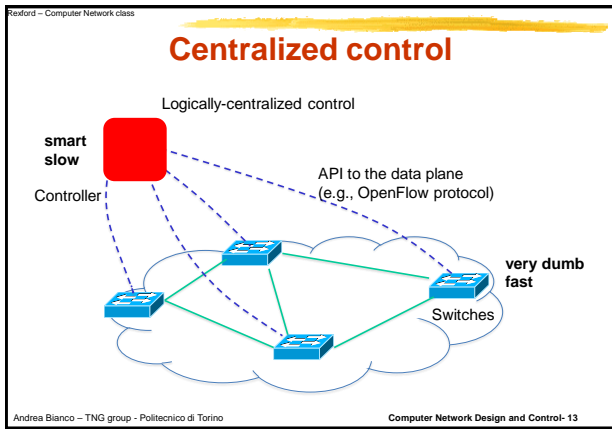

Software Defined Networking

- Capone - Netsol 2015
- ## Software Defined Networking*
- “New” key elements
 - Clean interface (API) between data and control plane
 - Logically centralized control plane
 - Control plane out of forwarding devices
 - Control plane (SW) may run on general purpose HW
 - Global network view
 - SDN controller or Network Operating Systems
 - Network programmability
 - New architecture
 - Flow based switching
 - Programmed by the centralized controller
 - Very flexible flow definition
 - Network applications running on top of NOS
- Andrea Bianco - TNG group - Politecnico di Torino
- Computer Network Design and Control- 11

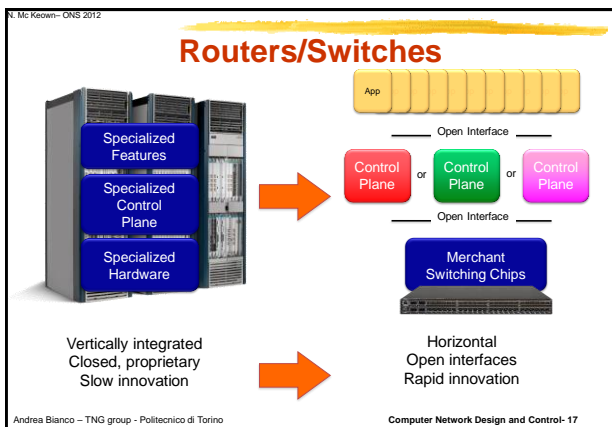

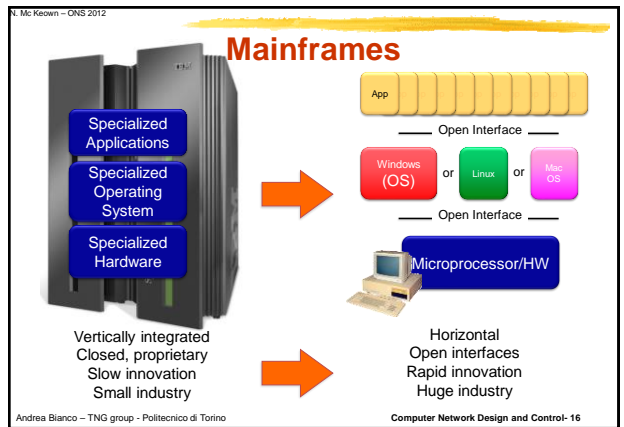

Software Defined Networking

A Helpful Analogy

From Nick McKeown's talk "Making SDN Work" at the Open Networking Summit, April 2012

Andrea Bianco - TNG group - Politecnico di Torino Computer Network Design and Control- 15

Flow-based forwarding*

- Protocol-less or protocol-oblivious forwarding
 - Not exactly true (set of predefined fields)
- Simple packet-handling rules
 - Pattern/rule: match packet header bits
 - Actions: drop, forward, modify, send to controller
 - Priority: disambiguate overlapping patterns

Andrea Bianco - TNG group - Politecnico di Torino Computer Network Design and Control- 18

Software Defined Networking

Flow based forwarding: table entries

Switch Port	MAC src	MAC dst	Eth type	VLAN Id	VLAN PCP	IP Src	IP Dst	IP ToS	IP Prot	L4 sport	L4 dport
-------------	---------	---------	----------	---------	----------	--------	--------	--------	---------	----------	----------

+ mask what fields to match

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 19

Unifies different kinds of “boxes”

- Router
 - Match: longest destination IP prefix
 - Action: forward out a link
- Firewall
 - Match: IP addresses and TCP/UDP port numbers
 - Action: permit or deny
- Switch
 - Match: destination MAC address
 - Action: forward or flood
- NAT
 - Match: IP address and TCP/UDP port
 - Action: rewrite address and port

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 20

Examples of “boxes”

Switching

Switch Port	MAC src	MAC dst	Eth type	VLAN ID	IP Src	IP Dst	IP Prot	TCP sport	TCP dport	Action
*	*	00:1f:..	*	*	*	*	*	*	*	port6

Flow Switching

Switch Port	MAC src	MAC dst	Eth type	VLAN ID	IP Src	IP Dst	IP Prot	TCP sport	TCP dport	Action
port3	00:20..	00:1f..	0800	vlan1	1.2.3.4	5.6.7.8	4	17264	80	port4

Firewall

Switch Port	MAC src	MAC dst	Eth type	VLAN ID	IP Src	IP Dst	IP Prot	TCP sport	TCP dport	Action
*	*	*	*	*	*	*	*	*	22	drop

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 21

Examples of “boxes”

Routing

Switch Port	MAC src	MAC dst	Eth type	VLAN ID	IP Src	IP Dst	IP Prot	TCP sport	TCP dport	Action
*	*	*	*	*	*	5.6.7.8	*	*	*	port3

VLAN Switching

Switch Port	MAC src	MAC dst	Eth type	VLAN ID	IP Src	IP Dst	IP Prot	TCP sport	TCP dport	Action
*	*	00:1f..	*	vlan1	*	*	*	*	*	port6 port7 port9

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 22

Controller to switch interaction

...	L3_SRC	L3_DST	L4_SRC	L4_DST	...	Action
	Any	112/8	Any	Any		Fwd-to: 2

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 23

SDN controller: network programmability

Events from switches
Topology changes
Traffic statistics
Arriving packets

Commands to switches
(Un)install rules
Query statistics
Send packets

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 24

Software Defined Networking

Reford - Computer Network class

Example of applications

- Dynamic access control
- Seamless mobility/migration
- Server load balancing
- Network virtualization
- Using multiple wireless access points
- Traffic engineering
- Energy-efficient networking
- Adaptive traffic monitoring
- Denial-of-Service attack detection
-

Andrea Bianco - TNG group - Politecnico di Torino Computer Network Design and Control- 25

Reford - Computer Network class

Application: Dynamic access control

- Inspect first packet of a connection
- Consult the access control policy
- Install rules to block or route traffic

Andrea Bianco - TNG group - Politecnico di Torino Computer Network Design and Control- 26

Reford - Computer Network class

Application: Seamless mobility/migration

- See host send traffic at new location
- Modify rules to reroute the traffic

Andrea Bianco - TNG group - Politecnico di Torino Computer Network Design and Control- 27

Reford - Computer Network class

Application: Server load balancing

- Pre-install load-balancing policy
- Split traffic based on source IP

Andrea Bianco - TNG group - Politecnico di Torino Computer Network Design and Control- 28

Kurose Ross: Computer Networking

Traffic engineering: difficult with traditional routing

Hp. Destination based routing

- What if network operator wants
 - u-to-z traffic to flow along uvwz
 - x-to-z traffic to flow xyz?
- Need to define link weights so traffic routing algorithm computes routes (or need a new routing algorithm)
- Does not work
 - Modifies many routes
 - Cannot change weights to route each individual flow

Andrea Bianco - TNG group - Politecnico di Torino Computer Network Design and Control- 29

Kurose Ross: Computer Networking

Traffic engineering: difficult with traditional routing

- What if network operator wants to split u-to-z traffic along uvwz and uxyz (load balancing)?
- Can't do it (or need a new routing algorithm)

Andrea Bianco - TNG group - Politecnico di Torino Computer Network Design and Control- 30

Software Defined Networking

Traffic engineering: difficult with traditional routing

- What if we want to route blue and red traffic differently?
- Can't do it (with destination based forwarding, and LS, DV routing)

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 31

SDN: switches

- Data plane switches
 - Fast, simple, commodity switches implementing generalized data-plane forwarding in HW
 - Switch flow table computed, installed by controller
 - API for table-based switch control
 - Defines what is controllable and what is not
 - Protocol for communicating with controller

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 32

SDN controller

- SDN controller (network OS):
 - Maintain network state information
 - Interacts with network control applications "above" via northbound API
 - Interacts with network switches "below" via southbound API

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 33

SDN application

- Network-control apps:
 - "Brains" of control: implement control functions using lower-level services, API provided by SDN controller
 - Unbundled: can be provided by 3rd party: distinct from routing vendor, or SDN controller

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 34

SDN controller components

- Interface layer to network control apps
 - Abstraction API
- State management layer
 - Distributed database
 - State of network links, switches etc
- Communication layer

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 35

SDN: pros and cons

- Potential benefits
 - Easier and faster innovation
 - Exploits global network view
 - Traffic engineering
 - Traffic steering
 - Security
 -
 - Simpler switches
 - Less costly
 - Less power hungry
 - «Avoids» device misconfiguration
 - Virtual resource management
- Potential drawbacks
 - Performance
 - Overheads
 - Scalability
 - Bottleneck
 - Single point of failure
 - Interoperability

Andrea Bianco – TNG group - Politecnico di Torino Computer Network Design and Control- 36

Software Defined Networking

SDN where?

- Campus LAN
- Data center
- WAN (google) to interconnect data centers
- ISP?
- 5G networks

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 37

The role of the scenario

- Datacenter
 - Very large number of devices
 - Spatially collocated
 - Low and predictable delays between devices
 - Dedicated network for control
 - Out of band control traffic
- ISP/POP
 - Lower number of devices
 - Spatially distributed
 - High and unpredictable latencies
 - Control and data share the same resources
 - In band control traffic

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 38

Level of aggregation

- Flow Based
 - Every flow is individually set up by controller
 - Exact-match flow entries
 - Flow table contains one entry per flow
 - Suited for fine grain control, e.g. campus networks
- Group Based
 - One flow entry covers large groups of flows
 - Wildcard flow entries
 - Flow table contains one entry per category/group of flows
 - Suited for large number of flows, e.g. ISPs

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 39

Level of aggregation

- High aggregation level
 - Dealing with few large objects
 - Reduced occupation of forwarding table
 - Reduced signaling overhead and controller load
 - Coarse granularity in the control of flow QoS
 - A flow steering moves a large amount of traffic
 - Less elements to deal with for load balancing but more difficult to balance

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 40

Reactive vs. Proactive

- Reactive
 - Flow table empty at boot
 - First packet of a flow sent to the controller
 - Controller inserts flow entries
 - Dynamic network

 - Every flow incurs small (?) additional flow setup time
 - Large control traffic
 - Large load on the controller
 - Efficient use of flow table
 - If control connection lost, switch has limited utility
- Proactive
 - Controller pre-populates flow table in switch at boot
 - Zero additional flow setup time
 - Static network

 - Loss of control connection does not disrupt traffic
 - Essentially requires aggregated (wildcard) rules
 - Reduced table size

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 41

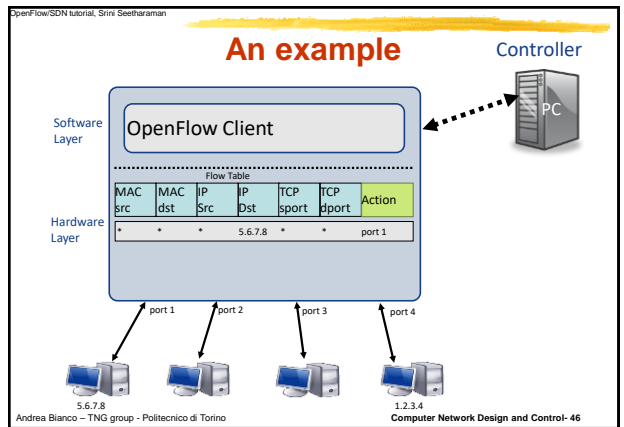

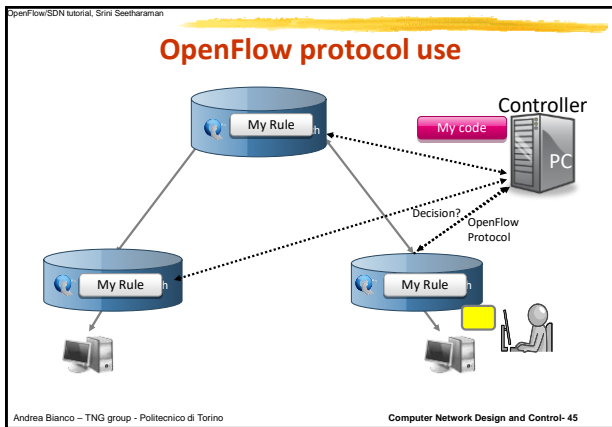

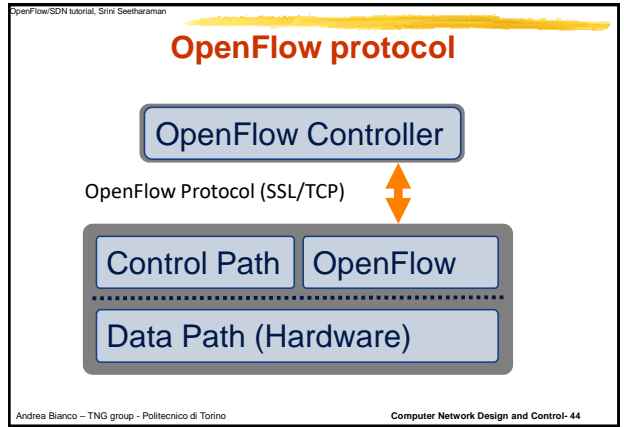

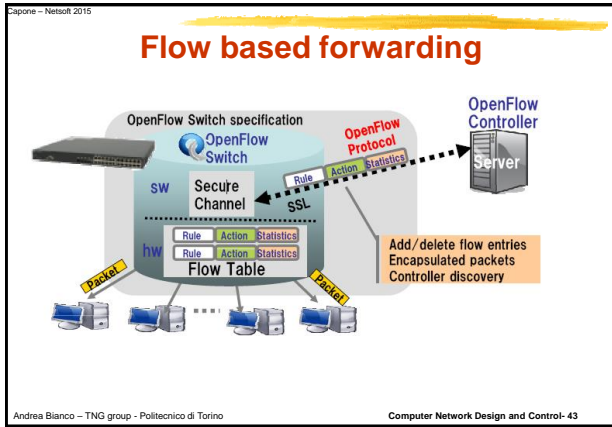

OpenFlow protocol

Andrea Bianco
andrea.bianco@polito.it
<http://www.telematica.polito.it/>

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 42

Software Defined Networking

- ## OpenFlow protocol messages
- Controller-to-switch
 - Initiated by the controller and used to directly manage or inspect the state of the switch
 - Features, Config, Modify State, Read State, Packet Out, Barrier
 - Asynchronous
 - Sent to the controller without controller soliciting
 - Packet-in, Flow Removed/Expiration, Port status, Error, ...
 - Symmetric
 - Sent without solicitation in any direction
 - Hello, Echo, Experimenter/Vendor
- Andrea Bianco - TNG group - Politecnico di Torino Computer Network Design and Control- 47

- ## OpenFlow (main) messages
- Packet_in
 - Switch to controller
 - Carries a packet copy (possibly only the header)
 - What is best?
 - Generated by default in case of table miss
 - Packet_out
 - Controller to switch
 - Send the packet out of a specified port
 - Carries the full packet or the switch buffer id
 - Flow_mod
 - Controller to switch
 - Modify flow tables
 - Carries match-action rule to install
- Andrea Bianco - TNG group - Politecnico di Torino Computer Network Design and Control- 48

Software Defined Networking

OpenFlow example

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 49

Packet processing

- Packets arrive and leave through ports
- Packets are matched to flow in flow tables using classifiers
- Flows contain set of instructions and actions applied to each packet in the match

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 50

Packet lifecycle

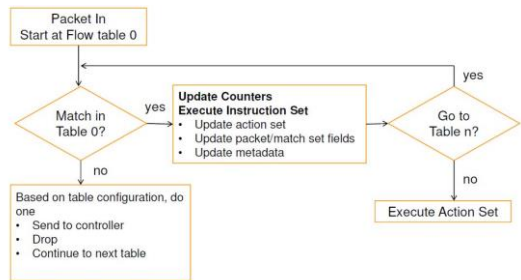

- On packet arrival a key is built
 - Metadata (arrival time, arrival port, memory location)
 - Fields in packet header
- Key is used to select a flow in the table
- Actions associated with the flow are applied
 - Drop, mutate, queue, forward, move to next table

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 51

Packet matching

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 52

Openflow switch implementation

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 53

Openflow versions

- Published by Open Networking Foundation
 - No profit
 - Funded by Deutsche Telekom, Facebook, Google, Microsoft, Verizon, etc.

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 54

Software Defined Networking

SDN architecture in action

Andrea Bianco
andrea.bianco@polito.it
<http://www.telematica.polito.it/>

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 55

An example

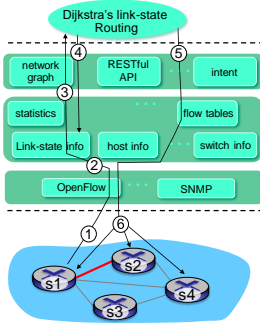

- ① S1, experiencing link failure using OpenFlow port status message to notify controller
- ② SDN controller receives OpenFlow message, updates link status info
- ③ Dijkstra's routing algorithm has previously registered to be called when ever link status changes. It is called.
- ④ Dijkstra's routing algorithm access network graph info, link-state info in controller, computes new routes

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 56

An example

- ⑤ Link state routing app interacts with flow-table-computation component in SDN controller, which computes new flow tables needed
- ⑥ Controller uses OpenFlow to install new tables in switches that need updating

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 57

Distributed controllers

Andrea Bianco
andrea.bianco@polito.it
<http://www.telematica.polito.it/>

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 58

Centralized vs Distributed Control

Centralized Control

Distributed Control

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 59

Why distributed/multiple controllers?

- To enhance resilience to failures
 - Controller failures can be managed
 - Still to deal with failures in data and control plane
- To solve scalability issues
 - Faster controllers
 - Limited scaling
 - More proactive rules to reduce number of requests
 - Limited flexibility
 - Multiple controllers
 - Permit load balancing to reduce processing load
 - Permit switch migration

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 60

Software Defined Networking

Distributed controllers

- Virtual topology among controllers
 - to coordinate the operations of the controllers
 - peer, hierarchical, master/slave
- Network view maintenance
 - different levels of consistency (strong/weak) among the controllers
 - affects the reactivity
 - may lead to temporary rule conflicts

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 61

Control plane in distributed controllers

- Switch-controller (Sw-Ctr) traffic
 - Standardized
- Controller-controller (Ctr-Ctr) traffic (East-West-bound interfaces)
 - Proprietary
 - To get consistent view
 - May be non negligible
 - Critical for reactivity

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 62

Stateful data plane

Andrea Bianco
andrea.bianco@polito.it
<http://www.telematica.polito.it/>

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 63

Stateful SDN dataplane

- Stateless approach (OpenFlow)
 - Stateless switches, all the states in the controller
 - Limited reactivity due to the (logically) centralized approach
- Stateful approach: OpenState, OpenPacketProcessor (OPP), P4
 - Permit some level of stateful processing (e.g., finite state machines) within switches
 - OpenState adds a state table (IF state A THEN IF state B THEN)
 - OpenPacketProcessor: state defined with multiple variables, counters,
 - P4 much more flexible (description language of HW behavior)
 - Enabled by new generation of hardware
 - 6.5Tbps Tofino chipset @ Barefoot Networks

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 64

Hardware implementation

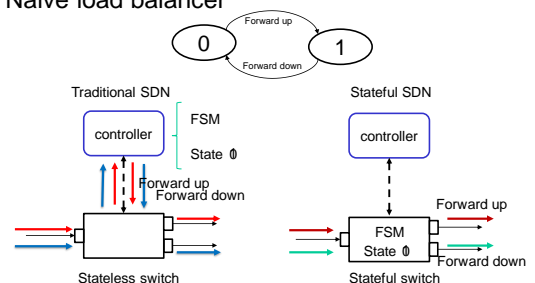

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 65

Toy example

- Naive load balancer

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 66

Software Defined Networking

Traffic classification

- Mirror a pre-defined number of packets to traffic classifier for each flow
- Interrupt the mirroring if the flow is identified

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 67

Stateful benefits

- Improve network reactivity
 - Simple local decisions at the switch
 - Reduced controller load
 - Reduced signaling overhead
- Permits to gracefully move functionalities
 - Balance central vs distributed control
- Not all switches need to be stateful
 - State positioning or distribution

Andrea Bianco – TNG group - Politecnico di Torino

Computer Network Design and Control- 68
